

## Clade 4 host-MAG abundance across four sample habitats

20 Clade 4 MAGs quantified in all 56 samples against one IS reference; reference-consistent sample comparison

Points are samples. This is a sample-level association, not evidence of activity or causality. Detection is TPM >0 after  $\geq 10\%$  covered fraction,  $\geq 95\%$  read identity and  $\geq 75\%$  aligned-read fraction. Station/core and depth are not adjusted in this provisional nonparametric test.
